

Trouble Ticket Handling Standard

1. Ticket Intake

All customer trouble reports must be logged as a ticket within 10 minutes of receipt. Each ticket must include the affected service, a contact channel, a priority, and a link to any related outage. Tickets created outside business hours are still subject to the same logging standard. Duplicate reports should be merged only after the related customer contacts are recorded.

2. Response Targets

P1 tickets require an initial response within 1 hour. P2 tickets require response within 4 hours. P3 tickets require response within 8 hours. P4 tickets require response within 24 hours. If the ticket is tied to a known outage, the response note must explain the outage linkage and the expected restoration window. Exceptions require manager approval.

3. Resolution Expectations

Priority 1 issues should be resolved within 8 hours whenever the cause is already known. Priority 2 issues should be resolved within 24 hours. Priority 3 issues should be resolved within 72 hours. Priority 4 issues should be resolved within 5 business days. Any case at risk of breach must be flagged in the daily queue review and assigned a next action.

4. Escalation and Ownership

Tickets that exceed response or resolution targets must be escalated to the next support tier. Ownership must be transferred with a written summary, troubleshooting steps already attempted, and the next diagnostic action. Escalated cases require acknowledgment within 30 minutes. If the customer is enterprise or wholesale, account management must be informed before the escalation is closed.

5. Status Management

Ticket statuses must follow Open, In Progress, Resolved, and Closed. Resolved status indicates that the service is restored and the customer has been notified. Closed status means all internal notes are complete and no further action is expected. Tickets may not move directly from Open to Closed unless a documented waiver is approved by the operations manager.

6. SLA Breach Handling

Any ticket with a response time above the target or a resolution time above the target is considered an SLA breach. Breached tickets require a post-incident note within one business day and must be reviewed during the weekly service meeting. Repeated breaches from the same service area require a corrective action plan with measurable milestones.

7. Reporting Requirements

Operations reports must summarize open tickets, breached tickets, average response time, and average resolution time by priority and by channel. The weekly report must also identify the top three outage-linked

ticket groups. Leadership uses this report to confirm whether service levels are improving and whether staffing changes are needed.
